Toolshop Product Detail: Requirement analysis questions (refined)

The AI output with required changes only. Removed: A2, A3, N1, I1 and G7 (the answer would not change an expected result), and I2 (fixed in the acceptance criteria, where "available" now reads "in stock"). I3 is reframed (highlighted). All other rows are as the AI wrote them. IDs are unchanged, so gaps in the numbering are the removed rows.

ID	Category	Requirement or AC	Question	Directed to	Criticality and what it blocks	Response	Status
G1	Gap	“the page should show the products related to the hammer”	What should the page show when a product has no related products: an empty section, a message, or nothing?	UX designer	Medium: a test for a product without related items can be written only by assuming the behaviour.		Open
G2	Gap	“When the visitor changes the quantity to <entered quantity>”	What happens when the visitor enters an empty value, a decimal such as 2.5, letters, or pasted text? Only whole numbers from -1 to 1000000001 are covered.	Product Owner	High: the expected quantity cannot be stated for any non-integer input.		Open
G3	Gap	“the hammer should not be available to add to the cart”	On an out-of-stock page, should the quantity field and the favorites action still be usable? What quantity is shown, given that the quantity scenarios only cover in-stock products?	Product Owner	Medium: the expected state of the other controls on an out-of-stock page is unknown.		Open
G4	Gap	“the visitor should be told that combination pliers could not be found”	What should be shown for a page address with a malformed identifier, as opposed to a well-formed identifier that has no product? Should the message be the same and offer a way back to the catalogue?	Business Analyst	Medium: tests for invalid addresses need an assumed result.		Open
G5	Gap	“the visitor should be told that they are not authorised to add a product to their favorites”	After this message, does the visitor stay on the page or go to a login screen? If they log in, is the product then saved to favorites?	Product Owner	Medium: the end state of the flow cannot be verified without an assumption.		Open
G6	Gap	“the cart should hold 1 hammer”	Does a visitor who is not logged in have a cart? Does the cart persist after a page refresh, a closed browser, or logging in?	Product Owner	High: it is unclear whether the cart scenarios apply to anonymous visitors, and what a persistence test should expect.		Open
G8	Gap	“When the visitor adds the hammer to the cart”	What should happen if the product goes out of stock after the page loads but before the visitor adds it to the cart?	Product Owner	Medium: the expected result of this timing case is assumed.		Open
G9	Gap	“When Jane Doe saves the hammer to her favorites”	What should happen if Jane Doe's session has expired when she saves the hammer?	Product Owner	Medium: the expected result for an expired session is unknown.		Open
G10	Gap	“the page should show the hammer's image, name, description and price”	What should the page show if the image or the description is missing for a product?	UX designer	Medium: a test for incomplete product data can be written only with an assumption.		Open
G11	Gap	“Given the catalogue contains a hammer priced at $14.50”	How is the price displayed: currency symbol, decimal places, thousands separator? Can a product show a discounted or sale price?	Business Analyst	Medium: the exact expected price text cannot be stated for other amounts.		Open
A1	Ambiguity	“the page should show the products related to the hammer”	What makes a product "related" (same category, same brand, or other)? How many related products are shown, in what order, and what is shown for each one?	Product Owner	High: the expected list of related products cannot be stated.		Open
A4	Ambiguity	“the visitor should be told that the hammer is out of stock”	What exact wording is used, and where on the page does the message appear?	UX designer	Medium: the expected text and position cannot be stated for the check.		Open
T1	Testability	“the visitor should see a confirmation that the hammer was added to the cart”	What does the confirmation look like (toast, banner, or page change), what does it say, and how long does it stay? Does the cart count in the header update?	UX designer	Medium: the test has no measurable check for the confirmation.		Open
T2	Testability	“the cart should hold 1 hammer”	Where does the tester check the cart contents: the header count, the cart page, or both?	Developer	Medium: the observation point for the result is not named.		Open
T3	Testability	“Jane Doe should see a confirmation that the hammer was added to her favorites”	What does this confirmation say and where does it appear? Where in the account area should the hammer be seen as saved?	UX designer	Medium: the expected message and location cannot be checked without them.		Open
I3	Gap (reframed from Inconsistency)	“the selected quantity should reset to 1”	Is the visitor told when a quantity outside the limits is reset? If so, what does the message say for a quantity below 1 and for one above 999,999,999?	Product Owner	Low: the value after the reset can be tested, but whether a message is expected cannot.		Open

ID	Category	Requirement or AC	Question	Directed to	Criticality and what it blocks	Response	Status
N2	Inaccuracy	“Quantity above 999,999,999 resets to 999,999,999”	Is 999,999,999 an intended business limit or a technical limit, such as a field or database size?	Product Owner	Medium: the boundary values 999999999 and 1000000000 depend on the real limit.		Open
